Congruent Labs

How Signata MFA Works

- YubiKey PIV Applet Issuance
- Uses your existing Active Directory and ADCS PKI
- On-prem or SaaS in your nearest Azure Datacentre

Congruent Labs

What does Signata MFA and PIV Enable?

Authentication

With Signata MFA, you can issue Authentication certificates into your YubiKeys, allowing you to use the same authentication certificate across your VPN, Desktops, RDP sessions to servers, and even the doors of your building.

Digital Signing

Need to approve a document? You can digitally sign emails, PDFs, Word Documents and more with certificates stored on your YubiKeys. Save a tree and keep your forms electronic.

Encryption

Need to share something sensitive, like employee personal information, passwords, or classified information? You can easily encrypt emails, PDFs, Word Documents and more using your YubiKeys, ensuring only the intended recipient can see the content.

Signata MFA Editions

Signata MFA - Standalone

- Perfect for standalone networks or classified environments.
- Fixed pricing – issue as many devices as you need and pay the same.
- Try for free for 31 days.

Signata MFA - Cloud

- For customers that don't want to host services themselves.
- Pay for only how many YubiKeys you need to manage.
- Try for free for 14 days.

Congruent Labs

Signata MFA Editions

Signata MFA - Standalone

- Uses your own Active Directory as an Identity Store.
- Uses your own ADCS PKI for the issuance of Certificates.
- Requires an IIS web server you can install the Signata MFA server on.
- Requires a desktop client to issue YubiKeys.

Signata MFA - Cloud

- Connect to your desired identity store, including Okta, Azure AD, On-prem AD, or manually created identities in our cloud console.
- Uses our Azure KeyVault-secured PKI for the issuance of certificates - you just have to install it in your trust store.
- Only install the desktop client in your network to issue YubiKeys.
